ApacheLogToDB Crack+ X64

ApacheLogToDB Torrent Download is a tool, which allows developers to collect the information from Apache server log files and to view it in a nice GUI. Developer can filter log messages to a particular source, e.g. IP, host name, query, request and so on. You can also easily collect the complete log information by specifying the value of 'maxRecords'. With the help of MySQL, ApacheLogToDB allows to easily create a database for storing log files. After installation, no database and log file creation will be necessary. Just start Apache, and the log collector will start. In the next step, you will be asked which log format should be used. Once the log format is selected, you will be able to view all messages collected from this log. You can filter log entries by date, host, url, query, or any combination of these parameters. In the next step, you will be asked if you want to view log statistics or log messages. The selection of 'statistics' option allows to view maximum and average values of parameters. Log messages can be viewed in tabular or graphical format. The most significant advantage of ApacheLogToDB is the possibility to store all collected information into a MySQL database. Once the database is created, you will be able to easily analyze collected log information with tools like MySQL Query Browser or PHPMyAdmin. Next version of ApacheLogToDB will be released as a collection of graphical tools. They will include WebAdmin, a GUI for working with ApacheLogToDB. New tools will include LogMerger, for combination of log files, and LogParser, to parse log messages. Credits: This project was written by Martin von Lewis, with the support of the Polish team of Apache Software Foundation. It is open source software. The following paragraph presents a table of contents, which contains all the modules described in the official Apache bulletin. WAVM-Utils Module Use this module to generate a WAVM-specific version of the Apache Commons Codec These are the Apache Commons Codec jars that are included in the WAVM distribution. This module also allows you to generate a WAVM-specific version of the Apache Commons BouncyCastle crypto api.

ApacheLogToDB Crack+ With Serial Key [Win/Mac] [Updated]

· sPW – encrypted password used to decrypt and manipulate the encrypted data record. · df – file delimiter · sFileKey – file key used to encrypt and decrypt data records. · cf – column delimiter · cn – column name · n – column number · ls – log start delimiter · ls1 – log string start delimiter · ls2 – log string end delimiter · ls3 – log comment string start delimiter · ls4 – log comment string end delimiter · inFile – file name to open. · outFile – file name to write the result to. · iflag – file indicating line number (for the header file) to read. This can be used to process header data only. · oflag – file indicating column number (for the header file) to read. This can be used to process header data only. · cntr – counter for reading column delimiters from the header file. · vsn – version string. If apacheLogToDB was compiled with support for versioning, vsn will contain the version and build number. · dl – display length. Only required when the server uses rexrpsr, that expects a limited number of characters to be shown. · tfn – token delimiter to treat strings · tfnu – string to treat as a number · tfu – string to treat as a float · ffmn – min length of string to treat as a number · fffmn – max length of string to treat as a number · fmf – min length of string to treat as a float · fffmn – max length of string to treat as a float · filmn – min length of string to treat as a float · fffmn – max length of string to treat as a float · kdf – key data format. See DataFormatOption · pw – password for decrypting the encrypted data · ks – key size in bytes · ck – verification key size in bytes · pvt – data record is the private part of a key and this private key is not meant to be published. · kt – key table name · sT – start time · eT – end time · k – key count, corresponds to the number of lines in the file. · pk – pseudo-key. This is 77a5ca646e

ApacheLogToDB Crack + With Serial Key

What's New In?

ApacheLogToDB is a simple, yet powerful utility that provides Apache log management functionality on the Windows platform. It is written in C++ with ATL for the Windows platform. Installation is as easy as installing any other Apache module: copy ApacheLogToDB.dll into your Apache's Apache\BIN folder and setup ApacheLogToDB.ini in that folder. ApacheLogToDB is quite small and requires almost no additional configuration besides Apache's httpd.conf and ApacheLogToDB.ini configuration file. Just enable logging in the httpd.conf and that's all. Features of ApacheLogToDB:

- Simple installation process. ApacheLogToDB is a .NET component. The main files are in .NET assembly that can be automatically deployed.
- Extensible. ApacheLogToDB allows installing additional modules that can extend log capabilities.
- Compatible with Apache log files from several versions of the Apache HTTP Server (2.2 and above).
- Allows logging to Microsoft SQL Server and MySQL databases.
- Allows logging of various operations: read, write, update, delete, as well as logging of errors.
- Provides many details on each operation and log record.
- Provides web page creation from Apache's log files.
- Allows to define log formatting by yourself, and to process formatted records by external programs.
- Filters - allows selection of only those log records that match specified criteria.
- Allows filtering of various fields from log records.
- Supports Unicode strings.
- Supports date/time format, such as date +time and date +/time+time, as well as formatting by the Apache style, such as %a, %b, %C and %t.
- Allows logging to SQL Server from the Windows NT platform.
- Allows filtering by user, by IP, by hostname or by filename.
- Allows to specify any log format that will be used for the particular operation (for SQL Server it is possible to define filters for each table).
- Allows to specify any database to which to connect.
- Supports remote logging from Apache servers.
- Allows to process generated log data by external programs.
- Allows to process log data generated by Apache itself.
- Allows to define filtering by time (12-hour, 24-hour, etc.) and to read log data from the local disk and from the remote SQL Server.
- Allows to store the log data in the local file system.
- Allows to store log data in a remote file server.
- Allows to specify whether to stop processing the log data.
- Allows to specify the number of log files. &bull

System Requirements For ApacheLogToDB:

Memory: RAM: 128 MB minimum Hard Drive: 16 MB minimum Video Card: Nvidia Geforce 8600 GT Sound Card: DirectX 9.0c Compatible sound card DirectX: DirectX 9.0c Compatible Local Video: Local Rendering: Local Multiplayer Support: No Remote Play Support: Yes Online Play Support: Yes (with Xbox Live, PlayStation Network, Nintendo WFC and Steam) In Game Menu: No
